Sequence 25, Application US/10381734

Sequence 25, Application No. US20040092434A1

GENERAL INFORMATION:

APPLICANT: BETZ, NATACHA

APPLICANT: BIKERIO, CYCLOPEPTIDES, A METHOD FOR THEIR PREPARATION AND THEIR USE AS INF

TITLE OF INVENTION: CYCLOPEPTIDES, A METHOD FOR THEIR PREPARATION AND THEIR USE AS INF

TITLE OF INVENTION: OR ACTIVATORS OF ANGIOGENESIS

FILE REPRENCE: 235834USOXPCT

CURRENT PELICATION NUMBER: PCT/FR01/0361,734

CURRENT FILING DATE: 2003-10-21

PRIOR APPLICATION NUMBER: PCT/FR01/03049

PRIOR FILING DATE: 2000-10-04

PRIOR FILING DATE: 2000-10-04

Dunny G.M., Suzuki A.; Suzuki A.; Suzuki A.; Suzuki A.; Suzuki A.; Structure of CCFIO, a peptide sex pheromone which induces conjugative transfer of the Streptococcus faecalis tetracycline resistance plasmach porlo."; J. Biol. Chem. 263:14574-14578(1988).

-!-FUNCTION: CCFIO is involved in the conjugative transfer of the hemolysin plasmid pCFIO.

-!-FUNCTION: CCFIO is involved in the conjugative transfer of the PIR; A30812; A30812.

Direct protein sequencing; Pheromone.

Avigad G.,

Identification of a peptide inhibitor of galactose oxidase from

Dactylium dendroides.";

Fed. Proc. 31:447-47(1972).

--- FUNCTION: Binds one copper ion per molecule but does not bind the

galactose oxidase apoenzyme. It may inactivate the enzyme by

Binding to its prosthetic copper group.

PIR; A01341; XEYDGD.

COPPER; Direct protein sequencing; Metalloenzyme inhibitor.

The present invention provides a number of heart homing peptides which selectively home to cardiac tissue. These can be used in the treatment of cardiovascular and ischaemic diseases, such as atherosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                           thrombosis, restenosis, vasculitis, atherosclerotic aneurysms, myocardial hypertrophy, congenital heart diseases, ischaemic heart disease and anginas, acquired valvular/endocardial diseases, primary myocardial diseases, cardiac tumours and arrhythmias
                                                                                                                                                                                                                                                                                                     Novel heart homing peptide that selectively homes to normal ischemic and cardiac tissue useful for targeting ischemic tissues for treating ischemic and cardiovascular diseases such as atherosclerosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB30895-99 represent targeting molecules, which are used to produce the chimeric molecules of the invention. AAB30895-98 selectively bind to normal cardiac endothelium. The specification describes a chimeric molecule comparising an angiogenic factor linked to a targeting molecule that specifically binds to a vascular endothelium. The chimeric molecule are useful for treatment of peripheral vascular or cardiovascular diseases. Specifically, they are useful for inducing or inhibiting angiogenesis, for increasing cardiac neovascularisation in ischemic tissue in the peripheral vascular system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New chimeric molecules having an angiogenic factor linked to a targeting molecule that binds to a vascular endothelium, useful for increasing cardiac neovascularization, or treating peripheral vascular and

The invention describes a fibronectin type III (Fn3) polypeptide monobody

(I) comprising 2 Fn3 beta-strand domain sequences with a loop region

sequence linked between adjacent beta-strand domain sequences; and

optionally an N-terminal tail of 2 amino acids, a C-terminal tail of 2

amino acids, or both. The loop region sequence, N-terminal tail, or C-

terminal tail comprises an amino acid sequence which varies by deletion,

insertion, or replacement of 2 amino acid sequence which varies by deletion,

in a wild-type Fn3 domain of fibronectin, and the monobody exhibits

nuclear receptor binding activity. (I) is used to screen a candidate drug

for nuclear receptor agonist or antagonist activity, and is used to

validate target protein activity. (I) is also used to measure the binding

affinity of (I) for a target protein, and can modulate target protein

cativity. A new method is used to identify (I). (I) can also be used in

therapeutics This is the amino acid sequence of a motif occurring in

therapeutics This is the amino acid sequence of a motif occurring in

monobodies selected in the presence of an agonist while using the Lexa-

cestrogen receptor alpha fusion protein as prey in a two-hybrid assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4; Conservative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                          This sequence represents a specific example of a peptide having antimalitin activity with an IC50 value of less than 30 microg/ml. It is useful for treating melittin poisoning. Melittin is the active compound in bee venom and causes cell lysis. Peptides having antimalittin activity have one of the following formulae; Ac-IVILLZZ-NH2; Ac-IVILTZ-NH2; Ac-IVILPZZ-NH2; Ac-IVILPZZ-NH2; Ac-IVILPZZ-NH2; Ac-IVILMZ-NH2; Ac-MILWIE-NH2; Ac-MILWIE-NH2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fibronectin type III polypeptide monobody useful for screening a candidate drug for nuclear receptor agonist or antagonist activity, and to validate target protein activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nuclear receptor antagonist; nuclear receptor agonist; fibronectin type III; Fn3; polypeptide monobody; nuclear receptor binding activity; drug screening; protein activity modulator; lexA; oestrogen receptor alpha; ER-alpha;

AAVIS618-Y15759 represent peptides used to make the fluorogenic or fluorescent reporter molecules of the invention. These molecules contain a peptide molecules of the invention. These molecules contain a peptide molecule or peptides enzymes involved in apoptosis or procease or peptidese enzymes. The capymes involved in apoptosis or procease or peptidese enzymes. The compounds can be used as fluorogenic or fluorescent substrates for enzymes. Depending on the peptide moiety used, the fluorescent molecules can be used for detecting or measuring the activity of an enzyme involved in the apoptosis cascade in cells; for determining the senativity of an animal with cancer to treatment with chemotherapeutic agents or determining whether a test substance inhibits, prevents, causes or enhances cell death of test cells; for determining whether a test compound has an effect on the activity of a viral protease in cells; for determining whether a test compound has an effect on the activity of a viral protease in cells; and for measuring the activity of a protease or peptidase in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protease substrate; fluorescent label; fluorophore; rhodamine;
blocking group; halobenzoyl group; cleavage; caspase; viral protease;
methionine aminopeptidase type 2; MetAP-2; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fluorophore-labelled protease substrate peptide, SEQ ID NO:103

                                                                                                                                                       g
                                                                                                                                                                                                                                    g
                                                                                                                                 ò
                                                                                                            The invention relates to fluorescently labelled peptides containing a halobenzoyl group on the fluorophore. They are of the structure peptide-Y -2, where Z represents a halo-substituted benzoyl blocking group, Y is a fluorescent or fluorigenic moiety (preferably a rhodamine), and the peptide-Y bond is cleavable by the enzyme being assayed. The labelled peptides are reporters for detecting intracellular proteclytic enzymes, particularly caspases and other enzymes involved in apoptosis, viral proteases (e.g., HIV, herpes simplex virus-1, human cytomegalovirus and hepatitis C virus proteases); and methionine aminopeptidase type 2 (MetAP-2). The peptides are particularly useful as agents for treating conditions such as cancer, neurodegeneration, autoimmune diseases, myocardial infection and virla infection. Modulators identified may also be used to prolong the life of cells being cultured for recombinant protein production, or to monitor the treatment of cancer with chemotherapeutic agents. Inhibitors of MetAP-2 are potential anti- angiogenic or anticancer agents. Sequences AAY80782-Y80910 represent peptides, some of which are specifically claimed, which may be used in assay methods
                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                    New fluorescently labeled amino acids or peptides, used as substrates for detecting enzymes or their modulators, e.g. anticancer or antiviral agents, contains a halobenzoyl N-blocking group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligopeptide possessing binding capacity to epimorphin and controlling activity of epimorphin, useful as hair growth retardant and hair growth stimulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an oligopeptide possessing binding

This invention relates to angiogenesis-inhibiting protein receptors, and the bNA sequences encoding them. Angiogenesis is the generation of new blood vessels into a tissue, and normally occurs in wound healing, foetal and embryonal development and the formation of the corpus luteum, endometrium and placenta. Angiostatin is a protein (see AAB16450 and AA68202) involved in angiogenesis, and has an amino acid sequence imilar to that of a plaeminogen fragment (see murine plaeminogen Engineer to that of a plaeminogen fragment (see murine plaeminogen Ragnestatin is also an angiogenesis inhibiting protein (see AAB16451 and AA68203). Sequences AAA68222 and AAB16522 represent coding and protein sequences of human laminin. Laminin is an angiostatin binding protein, and some of the peptides of the invention share homology with regions of laminin. Peptides AAB1642-B16521 (excluding AAB16490) are the angiogenesia-inhibiting protein receptor fragments of the invention. The peptides bind either angiostatin or endostatin and can be used in methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Regulating angiogenesis and treatment of angiogenesis-mediated diseases, e.g. hemangioma, tumors or cancer, by administering a tropomyosin binding compound or actin disrupting compound.
                                                                                                                                                                                                                                                                                                                          for treating diseases and processes that are mediated by angiogenesis, such as solid tumours, psoriasis, scleroderma, myocardial angiogenesis, crohn's disease, cerebral collaterals, arteriovenous malformations, rubeosis, diabetic retinopathy, arthritis, wound healing, peptic ulcers, Helicobacter related diseases, fractures, placentation and cat scratch fever. They are useful for the detection and prognosis of cancer. DNA sequences A628204-A628241 encode the peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; angiostatin; endostatin; angiogenesis; cancer; metastasis; psoriasis; scleroderma; Crobn's disease; corneal disease; retinopathy; arthritis; wound healing; Helicobacter pylori; peptic ulcer; gene therapy; angiostatin antagonist; endostatin antagonist; antiangiogenic; cytostatic; antiarthritic; antiinflammatory; cerebroprotective; antidabetic; virucide; antipyretic; vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Indels

                                                The present invention relates to methods of regulating angiogenesis in an individual by administering an angiogenesis regulating composition comportaing a tropomyosin binding compound or an actin distrubing compound. The compositions are useful for treating diseases and processes mediated by angiogenesis including haemangioma, solid tumours, blood bourne tumours, leukaemia, metastasis, Crohn's disease, coronary or cerebral collaterals, arthritis, diabetic neovascularisation, macular degeneration, wound healing, Helicobacter related diseases, ovulation, menstruation, and cat scratch fever. The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modulator; PDZ; post-synaptic density protein 95; PSD95;

protein. The modulator is a peptide having 3 residues of a C-terminal sequence of a PL protein. PDZ and PL proteins are a binding pair given in sequence of a PL protein, or a peptide mimetic of the 3 residue PL protein, or a specification, or a peptide mimetic of the 3 residue PL protein.

C small molecule having similar functional activity as the 3 residue PL protein. The reagents of the invention have the following activities: antinital largic, antinider, antideportatic, antiasthmatic, dermatological, neuroprotective, virucide, antidebotic, osteopathic, antiarthritic, immunosuppressive, antiatherosclerotic, cytostatic, anti-complexed, antideportatic, anti-complexed, antideportation of underported with binding between a PDZ protein and PL protein. The disease can be a neurological disease, immune response correlated with binding between a PDZ protein and PL protein. The disease can cancer. The modulator is useful for modulator is useful for modulating vesicular trafficking, tumour suppression, signal transduction, protein sorting, establishment of membrane polarity, correquiating the function of immune response and organisation of synapse formation. The modulator is useful for facilitating the assembly of multiportion of immune responses e.g., inflammatory and humoral immune responses e.g., inflammatory bowel diseases (viral infection site electrons and is ensemble to the involved the electrons of electrons and infection of electrons the electro

general No. 6335429

j General No. 6335429

j General INFORMATION:

APPLICANT: Weber, Eckard

APPLICANT: Cai, Sui Xiong

APPLICANT: Canny, Han-Zhong

APPLICANT: Zhang, Han-Zhong

TITLE OF INVENTION: No. 6335429e1 Fluorogenic or Fluorescence

TITLE OF INVENTION: Their Applications for Whole-Cell Fluorescence

TITLE OF INVENTION: Their Applications for Whole-Cell Fluorescence

TITLE OF INVENTION: Use Thereof

FILE REFERENCE: 1735.0290002

CURRENT FILING DATE: 1908-10-09

EARLIER APPLICATION NUMBER: US 60/061,582

EARLIER FILING DATE: 1998-10-09

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
